Large-scale Distributed Systems (3IN2032)

Filières concernées	Nombre d'heures	Validation	Crédits ECTS
Master en informatique	Cours: 2 ph Exercice: 2 ph	écrit: 2 h	5

ph=période hebdomadaire, pg=période globale, j=jour, dj=demi-jour, h=heure, min=minute

Période d'enseignement:

- Semestre Automne

Equipe enseignante:

Dr. Etienne Riviere ; Raziel C Gómez

Objectifs:

This course presents the paradigms, algorithmic techniques and design principles for large-scale distributed systems (LSDS) design.

The focus of the course is on decentralized, autonomous and self-organizing systems. It favors practical case studies of state-of-the-art system designs from academia and industry.

The course covers:

- LSDS characteristics and requirements,
- gossip-based protocols,
- DHTs and other routing/querying substrates,
- Highly-decentralized distributed file systems,
- Publish/subscribe (topic- and content-based) and multicast
- Swarming mechanisms for file distribution (BitTorrent)
- Selected topics based on students' interest.

A unique feature for a course on LSDS is the use of hands-on experimentation of a set of representative algorithms on a distributed testbed using real protocols deployments and no simulation. This task is made simple thanks to a specialized framework developed at the university and used by several research groups worldwide. The course features two tutorials (not graded) allowing an efficient bootstrap with the course and three practical projects. The last practical project subject can be selected among a set of propositions, depending on the interest of each student.

Contenu:

On successful completion of this course, you will:

- understand the key paradigms and services that one can use to build scalable distributed applications and systems;
- understand the objectives of fault tolerance, load balancing and efficiency and various techniques allowing to reach these objectives;
- have a practical experience in writing and evaluating code on a real large-scale testbeds, processing, presenting and discussing the results of your observation.

Forme de l'évaluation:

The evaluation is on the final exam (50% of the grade) and the grades of the project assignments (50%). There are 3 project assignments. They are mandatory and are due on fixed dates announced at the first lecture. Upon failure at the exam, the grade for the assignments will be kept when the student passes the exam another time (note that it is not possible to secure a 4 by passing only the exam due to the 50%/50% rule). Weekly quizzes are provided for self-evaluation of students' progress. These quizzes are corrected individually but are not graded.

Documentation:

no mandatory book. some research paper reading may be required during the course.

a publication about the course in a conference dedicated to distributed systems teaching can be found here:
<http://cs.gsu.edu/~tcpp/curriculum/?q=advanced-technical-program>

Pré-requis:

Mandatory: knowledge of imperative programming (e.g., C, Java, Python, Perl, etc.);

Recommended: prior course or seminar on small-scale distributed systems (distributed clocks, message passing, RPC, etc.)
